Ran into a jam while trying to post some Bash Script code where anything between would disappear. After a little trouble shooting, discovered it was the Media Module, search the modules Issue Tracker and found a [patch](#).

File which need to be edited:

sites/all/modules/media/includes/media.filter.inc

Around lines, 333-336 and 401

```
#$match = str_replace("", "", $match); # media-preserve-double-brackets-1828580-1.patch
#$tag = $match[0]; # media-preserve-double-brackets-1828580-1.patch
$input = $match[0]; # media-preserve-double-brackets-1828580-1.patch
$tag = str_replace("", "", $tag); # media-preserve-double-brackets-1828580-1.patch

catch (Exception $e) {
    watchdog('media', 'Unable to render media from %tag. Error: %error', array('%tag' =>
$tag, '%error' => $e->getMessage()));
    # return ''; # media-preserve-double-brackets-1828580-1.patch
    return $input; # media-preserve-double-brackets-1828580-1.patch
}
```
